Subject: RE: B160 Chapter 6 Workshop

My two-cents worth:

1 - Since a **primary** issue with this Water Plan Update is the fact that DWR has neither the data nor the analytic tools to determine: 1) how much water supply will be needed in 2030, and 2) how various scenarios might play out to provide that water; I submit that a primary state role will be to require / assist regions and districts to collect the type of data needed, in a usable form for future Updates.

2 - I would like to be sure that the phrase beneficiary pays means that, for example, when water from agriculture is made available for urban or environmental use, those who will benefit will pay the costs associated with receiving that water. As a follow up, when this is the case, who pays for water provided for environmental use?

In English any phrase that starts with "self" is hyphenated. In case of this one-page write up, that would be self-sufficiency.

Have a great meeting.

Anisa
